

INVESTIGATOR'S ANNUAL REPORT

National Park Service

All or some of the information provided may be available to the public

Reporting Year: 2005	Park: Shenandoah NP						
Principal Investigator: Dr Kurt Reinhart	Office Phone: (812) 855-1674 Email: kureinha@indiana.edu						
Address: Indiana University Dept. of Biology Jordan Hall Rm 127, 1001 East 3rd St. Bloomington, IN 47405- Bloomington, IN 47405-3700 US	Office Fax: (812) 855-6705						
Additional investigators or key field assistants (first name, last name, office phone, office email): <table border="0"> <tr> <td>Name: Keith Clay</td> <td>Phone: (812) 855-8158</td> <td>Email: clay@indiana.edu</td> </tr> <tr> <td>Name: Alissa Packer</td> <td>Phone: (570) 372-4217</td> <td>Email: packer@susqu.edu</td> </tr> </table>		Name: Keith Clay	Phone: (812) 855-8158	Email: clay@indiana.edu	Name: Alissa Packer	Phone: (570) 372-4217	Email: packer@susqu.edu
Name: Keith Clay	Phone: (812) 855-8158	Email: clay@indiana.edu					
Name: Alissa Packer	Phone: (570) 372-4217	Email: packer@susqu.edu					
Permit#: SHEN-2003-SCI-0015							
Park-assigned Study Id. #: SHEN-00290							
Project Title: The Role of Belowground Plant-Microbe Interactions in Plant Invasions							
Permit Start Date: Oct 15, 2003	Permit Expiration Date Aug 26, 2005						
Study Start Date: Oct 15, 2003	Study End Date Aug 26, 2005						
Study Status: Terminated before completed							
Activity Type: Research							
Subject/Discipline: Ecology (Aquatic, Marine, Terrestrial)							
Objectives: Objective <p>The objective of this project is to contrast the role of soil microbes, especially pathogenic fungi, in regulating the growth, survival, and ultimately the distribution of black cherry (<i>Prunus serotina</i>) trees in their native and non-native ranges. This study will test the hypothesis that resident soil microbial communities from the native range of <i>Prunus</i> will have a negative effect on <i>Prunus</i>, but resident microbial communities from the non-native range of <i>Prunus</i> will have a positive or neutral effect on this tree species. I will conduct parallel field studies and greenhouse experiments with soil microbes from the native (U.S.) and non-native (Europe) ranges of <i>Prunus</i>. This cross-continental comparison will consist of the following: 1) culture and identification of soil pathogens, primarily <i>Pythium</i> spp. in invaded and natural forests; 2) experiments testing the effects of soil biota origin, soil community, and individual and complexes of <i>Pythium</i> spp. on <i>Prunus</i> seedlings; 3) spatial distribution measurements of <i>Prunus</i> dispersion within forests. The proposed cross-continental comparison will experimentally test whether resident soil microbes help facilitate invasion of <i>Prunus</i> in its non-native range as a result of escaping from soil pathogens that exist within the natural range of this tree species.</p> Background Previous research reported by my collaborators suggests that soil pathogens reduce the abundance of black cherry and help to maintain tree diversity							

within temperate forests (see attached paper by Packer and Clay in Nature, 2000). A major portion of my research places emphasis on plant-soil biota interactions across the native and non-native ranges of black cherry. Sampling in Shenandoah National Park will dramatically improve our understanding of how black cherry interacts with the soil community within its native range.

Findings and Status:

No activity was conducted this report year.

For this study, were one or more specimens collected and removed from the park but not destroyed during analyses?

No

Funding provided this reporting year by NPS:

0

Funding provided this reporting year by other sources:

0
